

Technical Data**ARTICLE INFO**

The single-point controller humidity switch is a moisture-independent automatic release, which is used for ventilation purposes in SHE and ventilation systems. It has an adjustable humidity range of 35 % to 100 % and uses a sensor to regulate the moisture content in the room. As soon as the value set on the humidity switch is exceeded, the humidity switch activates the ventilation, thus naturally regulating the moisture content in the room.

Measurement of humidity for sHE and ventilation systems

Equipped with a sensor, the hygostat measures the moisture content in the room. If exceeded, the ventilation is activated and the moisture content is regulated. In addition, the desired humidity range can be set.

Humidity switch at a glance:

- Adjustable humidity range from 35 % to 100 %
- humidity switch for measuring humidity
- Can be combined with other operating elements in the building
